Title VI Notice

Thurston Regional Planning Council (TRPC) hereby gives public notice that it is the agency’s policy to assure full compliance with Title VI of the Civil Rights Act of 1964, the Civil Rights Restoration Act of 1987, and related statutes and regulations in all programs and activities. Title VI requires that no person shall, on the grounds of race, color, sex, or national origin, be excluded from the participation in, be denied the benefits of, or be otherwise subjected to discrimination under any Federal Highway Aid (FHWA) program or other activity for which TRPC receives federal financial assistance. Any person who believes they have been aggrieved by an unlawful discriminatory practice under Title VI has a right to file a formal complaint with TRPC. Any such complaint must be in writing and filed with the TRPC’s Title VI Coordinator within one hundred and eighty (180) days following the date of the alleged discriminatory occurrence.

THURSTON REGIONAL PLANNING COUNCIL (TRPC) is a 23-member intergovernmental board made up of local governmental jurisdictions within Thurston County, plus the Confederated Tribes of the Chehalis Reservation and the Nisqually Indian Tribe. The Council was established in 1967 under RCW 36.70.060, which authorized creation of regional planning councils.

TRPC’s mission is to “Provide Visionary Leadership on Regional Plans, Policies, and Issues.”

To Support this Mission:

- Support **regional transportation planning** consistent with state and federal funding requirements.
- Address **growth management, environmental quality, economic opportunity**, and other topics determined by the Council.
- **Assemble** and **analyze data** that support local and regional decision making.
- Act as a “**convener**” to build regional **consensus** on issues through information and citizen involvement.
- Build **intergovernmental consensus** on regional plans, policies, and issues, and advocate local implementation.

People gather at the Washington State Capitol Building in September 2019 to rally for action on climate change. Source: TRPC
1. Introduction

“It is no longer enough just to change our lifestyles. We need to be changing our communities.”

Kaylee Shen, Olympia High School student

It’s September 20, 2019, and a crowd is growing on the steps of the Washington State Legislative Building in Olympia. Although it’s the middle of a school day, the more than 2,000 people flooding up the pathways are mostly middle and high school-aged youth. They hold up colorful hand-printed signs with slogans like “Time is Running Out” and “The climate is changing, why aren’t we?” Students from across the Thurston region have walked out of classes this day as part of a Global Youth Climate Strike. They ask their government to recognize climate change as an emergency that threatens their future, and demand that those in power take ambitious action to address it. At a podium, young organizers of the rally speak with poise and passion about their fears for a world impacted by climate change, their determination to steer a different course, and their hope that local leaders are listening...
Climate change is already affecting our communities. Impacts like hotter summers, wildfire smoke, and flooding endanger our homes, damage public health, and affect local business. The Thurston Climate Mitigation Plan is a continuation of the efforts of the Thurston Regional Planning Council (TRPC), Thurston County, and the cities of Lacey, Olympia, and Tumwater to prepare for and reduce the impacts of climate change. This plan presents a framework for climate mitigation in our region. It includes actions these local governments can take to make measurable progress toward greenhouse gas emission reduction goals, while maintaining—and even improving—quality of life in our region. Transforming our community to meet the challenges of climate change will require participation from every segment of society—public agencies and private businesses, parents, students, scientists, artists, producers, and consumers. This plan is not intended to be the last word on climate action, and it doesn’t have all the answers. Instead, it begins a conversation about how local governments can best act together, and enable and empower their residents to build a future in which we can all thrive. While that future brings risk and uncertainty, it also promises great opportunity.

We have one planet but many climate solutions, so let’s get to work.

A firefighter overlooks damage resulting from a wildfire in eastern Thurston County. A warming climate is projected to exacerbate wildfire risks in coming decades. Source: McLane Black Lake Fire Department
1.1 What is Climate Mitigation?

Climate mitigation refers to actions that take heat-trapping greenhouse gases like carbon dioxide out of the atmosphere or prevent them from entering the atmosphere in the first place. The amount of greenhouse gases we emit is directly related to how warm the planet will become. The more emissions we produce through our activities, the more severe and damaging climate change impacts will be.

Reducing—or mitigating—our emissions locally will help to limit the amount of warming we will experience globally and will mean fewer negative impacts on our community and region. Reducing emissions can help protect our infrastructure and the health and safety of our families.

1.2 A Foundation of Regional Sustainability Planning

The Thurston Climate Mitigation Plan builds on many years of sustainability work across our region. Prior to this planning effort, Thurston County and the cities of Lacey, Olympia, and Tumwater had all adopted plans or resolutions expressing their commitments to address climate change by reducing greenhouse gas emissions.

- **Thurston County:** The Board of County Commissioners adopted Resolution 14395 in 2010 that set the County on a “pathway to zero greenhouse gas emissions” from its municipal operations and says the County shall develop and implement an “adaptable, long-term plan considering all aspects of Thurston County operations as they relate to energy and greenhouse gas emissions.”

- **Lacey:** In 2016, Lacey completed the Carbon Reduction and Resiliency Plan (CR2), which identified climate risks to the city and outlined actions to mitigate those impacts through preparedness and greenhouse gas reductions. The Lacey City Council adopted the CR2 plan as an appendix to the Lacey Comprehensive Plan.

- **Olympia:** In response to a citizen asking the Olympia City Council about what the City was doing to address the issue of global warming, the first interdepartmental team to address climate change was formed in 1990. Based on the team’s work, the City committed to a three-part strategy to address the “challenge of global climate change,” including the reduction of greenhouse gases. Since 1990, Olympia has taken steps to reduce its municipal greenhouse gas emissions through concrete actions such as installing solar panels on city facilities, has shown its commitment to climate mitigation through participation in organizations such as the Global Covenant of Mayors and has revised its Comprehensive Plan to include climate policies.

- **Tumwater:** In 2008, Tumwater completed a Climate Action Plan, which measured and projected the city’s municipal emissions, identified existing mitigation actions, and proposed additional measures to reduce emissions from municipal operations.

- **Thurston Regional Planning Council:** In 2013, TRPC adopted Sustainable Thurston, which set a priority goal for the Thurston region to “move toward carbon neutrality,” and identified “find resources to work on climate change” as a first action step.
Climate Adaptation

In 2018, TRPC adopted the Thurston Climate Adaptation Plan, which includes a summary of observed and projected impacts from climate change on the Thurston region (see sidebar), a vulnerability assessment of the risks those changes pose to community goals, and a list of more than 90 actions to help our region prepare for and adjust to climate impacts. The Thurston Climate Mitigation Plan builds on that same science-based foundation, to address local contributions to the causes of climate change. Together, the two documents form a comprehensive Climate Action Plan for the Thurston Region.

How Will Climate Change Affect the Thurston Region?

Our climate is changing in ways that will have significant implications for human and natural systems. The Thurston Climate Adaptation Plan summarized observed and projected climate change impacts, using information from the United Nations Intergovernmental Panel on Climate Change (IPCC) and the University of Washington Climate Impacts Group. This report informed a Vulnerability Assessment that identified major risks to our area from climate change:

Outlook

The region’s average annual air temperature will continue to rise over the 21st Century. While there will continue to be variability from year to year, due in part to atmospheric cycles like EL Nino and La Nina, we can generally expect to experience hotter, drier
In 2019, the City of Olympia, the LOTT Clean Water Alliance, and the Port of Olympia completed the jointly funded Olympia Sea Level Rise Response Plan. This plan identifies the actions that are required to protect Downtown Olympia and the Port peninsula from rising seas.

Review the Thurston Climate Adaptation Plan for additional information on these risks and regional actions to reduce our vulnerability.

summers and warmer, wetter winters. These changes are anticipated to worsen existing hazards—like floods, landslides, and wildfires—and introduce new threats—like invasive plants, insects, and infectious diseases.

Climate scientists predict that without significant reductions in greenhouse gas emissions by the 2050s, we can expect:

- Temperature on hottest days to increase by 6.5 degrees. Our average high in August will increase to 94 degrees, from 88 degrees.
- Summer rainfall to decrease by 22 percent, and minimum streamflows in the Nisqually River to drop by 27 percent.
- More frequent rain events in winter, with the heaviest storms dropping 20 percent more precipitation.
- Less winter precipitation falling as snow, with peak river flows arriving up to a month earlier.

Risks and Impacts

- Shrinking snowpack changes streamflow timing, affecting groundwater recharge and fish habitat.
- Changing oceans (acidification and temperature) threaten local subsistence and commercial fisheries.
- Rising sea levels exacerbate coastal flooding and erosion, and undermine infrastructure and wells.
- Warming lakes and streams threaten water quality, increase algae blooms, impacting human health and aquatic species.
- Intensifying storms increase flood damage to structures and endanger people.
- Deepening droughts spur water shortages, wildfires, crop and livestock losses.
- Expanding wildfires endanger people and property and increase health impacts from air pollution.

Review the Thurston Climate Adaptation Plan for additional information on these risks and regional actions to reduce our vulnerability.
1.3 What is in this Plan… and What is Not

The Thurston Climate Mitigation Plan is the sum of many parts completed over a more than year of conversations, research, and analysis. Those pieces include:

- A shared vision for how climate mitigation activities align with community goals. (Chapter 2—Vision, Goals, & Guiding Principles)
- An understanding of the activities in our community that contribute greenhouse gas emissions that cause climate change. (Chapter 3—Background)
- A list of communitywide actions that aim to lower greenhouse gas emissions and help our region progress toward adopted reduction targets. (Chapter 5—Strategies & Actions)
- An estimate of how those actions can—collectively—enable our region to achieve the substantial emission reductions targeted by the four partner jurisdictions. (Chapter 4—Plan Development, Section 4.4 – Emissions Target Analysis)
- A strategy for implementing climate mitigation actions (Chapter 6—Implementation Strategy)

Taken together, the Thurston Climate Mitigation Plan lays out a road map for continuing regional collaboration on reducing local contributions to climate change.

This plan is not a decision-making document under the State Environmental Policy Act. It is intended to provide perspective on the challenge of meeting emission reduction goals and provide a selection of actions that, if implemented, would help achieve these goals.

More to Learn

While we learned a lot, this process also revealed many gaps in our knowledge that we’ll need to fill as we move ahead. This plan is intended to provide Thurston County and the cities of Lacey, Olympia, and Tumwater with a framework of solid strategies that will guide next steps, not lock them into specific tasks that may not make sense as we work out the details. We’ll need to do more to understand the potential costs of actions, how they may impact different parts of our community, and the tools and resources available to get the work done. We’ll need to better understand and quantify the role carbon sequestration can play in our overall strategy. We’ll need to continue listening to what our community needs and wants and bring even more voices into those conversations.
We completed this plan as the Thurston region grappled with the impact of the COVID-19 pandemic. This global public health emergency has revealed how fast, and how thoroughly, our expectations about the future can be upended. Our analysis is based on assumptions about what the future will look like and what we can or cannot do to change it. However, in the coming years, new laws, technologies, scientific discoveries, and economic and social disruptions will undoubtedly shake up the options available to us for addressing climate change in ways we can’t predict today. The project partners acknowledge that successful implementation will require adapting to changing conditions and new information as we go.

We also recognize that though this plan focuses on what local governments can do to reduce greenhouse gas emissions, that is only a portion of the change that will be needed across our society to avoid the most severe impacts of climate change. According to a recent survey, while seven in ten Americans say they wish there were more they could do to combat climate change, more than half say they don’t know where to start. Throughout this plan, we highlight climate mitigation efforts already underway in our community. These examples demonstrate just a fraction of the incredible energy and ingenuity that people in the Thurston County region are bringing to this global challenge.

Climate change is a global challenge that has no borders. It will take meaningful action from governments and individuals across the country and around the world to change course. The Thurston region makes up just a small portion of that global puzzle. But by starting locally, we can do our part and show others the way. Our action, when multiplied by millions, can change the world. The four jurisdictions involved in this plan recognize that though they bring different perspectives and priorities to this challenge, by working together, we can amplify our impact. Together, we can build a more resilient, sustainable, and equitable future.

**What We Heard...**

“None of us will have a future if we don’t save our planet, which is why we are demanding:

1. Major legislation be passed to combat climate change at state and local levels.
2. Adopt practices to shift our country to 100% clean, renewable, and net-zero emission energy sources through a fair and just transition for all communities and workers.
3. Declare the climate crisis a national emergency, because that’s what it is.

We will continue to demand these things, and if adults don’t listen, trust me, I’m prepared to yell louder.”

-- Elyanna Calle, Timberline High School student, organizer of the 2019 Olympia Climate Strike
View of the Capitol Dome and Black Hills.
Source: TRPC
2. Vision, Goals, and Guiding Principles

“Thurston County, Lacey, Olympia, and Tumwater, and neighboring tribes recognize the urgent threat and opportunity that climate change poses to our community’s economy, public health, public safety, and environment. We will work together to identify and boldly implement the most effective, efficient, and equitable actions to reduce locally generated greenhouse gas emissions to protect current and future generations from the most severe impacts of climate change.”

– Vision Statement, Thurston Climate Mitigation Plan
From the start of this planning process, community members and policymakers expressed a desire to focus on action. They emphasized the need to understand what it will take to achieve meaningful progress on reducing local contributions to climate change, and to build broad community support for investment in those solutions. While much about the coming decades is uncertain—how exactly climate change will affect us, what technology may become available, what policy direction may come from the state and federal government—the partners on this project committed to finding tangible, practical steps that will put our region on the path toward a more secure and thriving future.
The vision for the Thurston Climate Mitigation Plan is:

“Thurston County, Lacey, Olympia, and Tumwater, and neighboring tribes recognize the urgent threat and opportunity that climate change poses to our community’s economy, public health, public safety, and environment. We will work together to identify and boldly implement the most effective, efficient, and equitable actions to reduce locally generated greenhouse gas emissions to protect current and future generations from the most severe impacts of climate change.”

This statement, coupled with the one below from the Thurston Climate Adaptation Plan, constitute an overall vision for climate action in the Thurston region.

“In addition to doing its part to reduce greenhouse gas emissions, the Thurston County region will remain resilient in the face of climate change impacts during the 21st century and beyond.”
2.2 Emissions Targets and Project Goals

The primary focus of the Thurston Climate Mitigation Plan is to identify actions that will enable our region to work collectively to minimize the causes of climate change. To that end, in 2018 the four jurisdictions adopted shared emissions reduction targets (Appendix 10.1). These targets are in line with those set by other countries and communities around the world and ensure that our community does its part to address global climate change.

**EMISSIONS REDUCTION TARGETS**

- **2015**: 45% reduction to ensure that our community does its part to keep the global average temperature from rising more than 2° Celsius (3.6° F) above historic levels.
- **2030**: 85% reduction.
- **2050**:
Emissions Reduction Target

Reduce net communitywide greenhouse gas emissions 45% below 2015 levels by 2030 and 85% below 2015 levels by 2050 to ensure that our community does its part to keep the global average temperature from rising more than 2° Celsius (3.6° F) above historic levels.

Along with the emissions targets, the Steering Committee adopted regional goals that emphasize the co-benefits of climate action in supporting the strength and resilience of the broader community. These 12 goals are drawn from TRPC’s 2013 Creating Places—Preserving Spaces: A Sustainable Development Plan for the Thurston Region (Sustainable Thurston), and guided the Thurston Climate Adaptation Plan.

REGIONAL GOALS

1. Create vibrant centers, corridors, and neighborhoods while accommodating growth.
2. Preserve environmentally sensitive lands, farmlands, forest lands, prairies, and rural lands, and develop compact urban areas.
3. Create a robust economy.
4. Protect and improve water quality, including groundwater, rivers, streams, lakes and Puget Sound.
5. Plan and act toward zero waste in the region.
6. Ensure that residents have the resources to meet their daily needs.
7. Support a local food system to increase community resilience, health and economic prosperity.
8. Ensure that the region’s water supply sustains people in perpetuity while protecting the environment.
9. Move toward a carbon-neutral community.
10. Maintain air quality standards.
11. Provide opportunities for everyone in the Thurston Region to learn about and practice sustainability.
12. Make strategic investments to advance sustainability regionally.
How do our emissions reduction targets compare to international and state targets?

In 2014, the Intergovernmental Panel on Climate Change (IPCC) concluded that the United States and other industrialized countries need to reduce emissions 85-90 percent from 1990 levels by 2050 to stabilize atmospheric concentrations of carbon dioxide and other heat-trapping gases at 450 parts per million. Achieving this target will likely keep the global average temperature from rising 2° Celsius above pre-industrial levels by the end of this century, and thus avoid the most severe climate impacts. These are the goals that were included in the 2016 Paris Agreement, which has been signed by 194 individual countries and the European Union. The IPCC has further recommended that countries aim to limit global warming to 1.5° Celsius by accelerating reductions in the coming decades—reducing emissions by 45 percent from 2010 levels by 2030 and achieving "net zero" by 2050.

In 2020, as this plan was being developed, Washington State adopted updated greenhouse gas emission limits for consistency with the most recent science assessments:

- By 2020, reduce emission to 1990 levels
- By 2030, reduce to 45 percent below 1990 levels
- By 2040, reduce to 70 percent below 1990 levels
- By 2050, reduce to 95 percent below 1990 levels, and achieve net zero greenhouse gas emissions

Washington State also adopted strong emission reduction targets for the operation of state agencies, many of which are based in Thurston County, and make up a significant portion of the local employment base.

Going forward, actions at the state, national, and international level will influence the Thurston region’s ability to achieve our goals. Successful implementation of this plan will include periodically reviewing and revising its goals and targets as new information expands our understanding of the best routes to address climate impacts.

What We Heard...

“Strategies that center our tribes—Squaxin Island, Nisqually, Chehalis”

Comment at Olympia Arts Walk

“Create realistic list of actions that individuals can do to help.”

Response on community questionnaire

“Make sure that all residents of the county, regardless of income levels or background, can participate in the clean energy economy and benefit from it.”

Response on community questionnaire
2.3 Guiding Principles

In addition to the project goals, ten guiding principles governed the planning process. These principles built on those from the Thurston Climate Adaptation Plan and influenced all pieces of this climate mitigation strategy.

1. **Holistic.** Think in terms of multiple generations and connected built and natural systems, as well as view local and regional decisions through the lens of social, economic, and environmental sustainability.

2. **Action-oriented.** Develop actions and strategies that are meaningful and realistic: go beyond general guidance to identify the specific steps needed to make changes that are effective at reducing greenhouse gas emissions below the emission targets.

3. **Adaptive.** Consider both the short- and long-term impacts of climate change, regularly report on progress, and review and revise targets and approaches as needed to address emerging information about the timing and severity of climate impacts or the effectiveness of policies.

4. **Co-benefits.** Identify and leverage climate change mitigation strategies and actions that offer other benefits to the community, such as increasing resilience or access to resources, reducing energy or other costs, improving health outcomes, or addressing equity.

5. **Science-based.** Utilize sound scientific research, modeling, economic analysis, and other tools to understand the outcomes of strategies to reduce greenhouse gas emissions.

6. **Track record.** Incorporate and complement work produced by others, including successful examples from existing local and regional climate action plans.

7. **Equity.** Consider how the costs and benefits of mitigation actions will be shared across all communities: including both urban and rural areas, low-income households, communities of color, and other populations that historically have been impacted by environmental hazards or are otherwise vulnerable to climate impacts.

8. **Tribal sovereignty.** Recognize and support protection of local indigenous tribes’ community health and well-being, including natural resources security and self-determination.

9. **Public engagement.** Seek broad community input, educate residents about climate change, and inspire them to take action.

10. **Readiness.** Consider and prioritize strategies that can be launched and realized quickly using existing resources and/or networks.

3. Background

“Pathways limiting global warming to 1.5°C with no or limited overshoot would require rapid and far-reaching transitions in energy, land, urban and infrastructure (including transport and buildings), and industrial systems. These systems transitions are unprecedented in terms of scale, but not necessarily in terms of speed, and imply deep emissions reductions in all sectors, a wide portfolio of mitigation options and a significant upscaling of investments in those options.”

IPCC, 2018
Every kilowatt we use, mile we travel, and ounce of food and waste we produce contributes—either directly or indirectly—to our carbon footprint. As the Thurston region grows, more buildings, more vehicles, and more demand for goods and services come at a cost we’ll eventually pay in impacts from climate change. Bringing down concentrations of carbon dioxide (CO$_2$), methane (CH$_4$), and other heat-trapping gases in the atmosphere is the most important action we can take to slow the warming of our planet. That’s why the Thurston Climate Mitigation Plan sets ambitious goals to reduce local generation of greenhouse gases. This chapter describes what we know about our current contributions to climate change and presents success stories of how our community is already working to reduce our impact.

### 3.1 Greenhouse Gas Emissions

Sources of greenhouse gas emissions in Thurston County include:

- **Buildings and energy**, including electricity and natural gas consumption.
- **Transportation and land use**, including fuels used to power vehicle travel.
- **Agriculture and forests**, including animal farming and land fertilization.
- **Other sources** such as refrigerant use, street lighting, and land clearing.

Currently, the majority of our region’s contributions to climate change come from powering, heating, and cooling our buildings and driving vehicles. The built environment and transportation account for 90 percent of Thurston County’s total emissions. Emissions related to solid waste disposal, wastewater treatment, agriculture and land use, and refrigerant leakage also contribute to the county’s total, but a much smaller percentage.
Figure 1. Sources of Thurston County Greenhouse Gas Emissions, 2018. Source: TCAT, 2020

Figure 2. Total Thurston County Greenhouse Gas Emissions, 2010-2018. The baseline target year 2015 is highlighted. Source: TCAT, 2020.
The Thurston region’s total carbon footprint in 2018 was 3,207,845 metric tons of carbon dioxide equivalent (MTCO$_2$e)—that amount is equivalent to the emissions from nearly 700,000 passenger vehicles in a year. While annual emissions have fluctuated over the past decade, our total emissions have been increasing over time—including by more than seven percent since our target baseline year 2015. This upward trend will make our emissions targets that much more challenging to reach.

On a per-capita basis, each Thurston region resident emitted an average of 11 MTCO$_2$e in 2018. A Thurston region resident contributes fewer emissions than the average residents of Washington State as a whole, and less than the average American, but more than the average residents of King, Kitsap, Pierce, and Snohomish Counties. While emissions per person has held relatively steady over the past decade, Thurston County is one of the fastest growing regions in Washington. That population growth accounts for some of our increases in emissions.

![Figure 3](image-url)

**Figure 3.** Thurston County Per Capita Emissions and Population, 2010-2018. The Baseline Target Year 2015 is Highlighted. Source: TCAT, 2020.
Greenhouse Gas Inventory

The Thurston Climate Action Team (TCAT) has tracked our regional carbon footprint regularly since 2010. TCAT is a local non-profit made up of experts and members of the public who develop data and advocate for climate change action in our community. TCAT uses a protocol developed by the International Council of Local Environmental Initiatives (ICLEI) and the World Resource Institute to calculate our regional carbon footprint. (Greenhouse Gas Inventory, Appendix 10.2)

What about emissions from goods and other sources produced outside Thurston County?

The method TCAT currently uses to develop the Greenhouse Gas Inventory only tracks emissions from activities that occur within the Thurston region. That means it does not measure the impact of many choices made by people in the Thurston region that contribute to global emissions, such as travel beyond the county boundary (including all air travel) and goods purchased and consumed here that are manufactured elsewhere. This is why solid waste and agriculture make up such a small proportion of the current emissions inventory. A full account of the community’s climate impact should recognize these consumption-based emissions. While TCAT currently lacks a reliable way to accurately measure consumption-based emissions, the partners involved in this project recognize the large role they play in our region’s carbon footprint. These activities may be incorporated into future updates of the plan as better information becomes available.
HOW DO WE COMPARE?
Metric Tons of Carbon Dioxide Equivalent (MTCO₂e) per person

UNITED STATES: 20.6
OREGON: 15.7
WASHINGTON: 13.8
THURSTON COUNTY: 10.9
KING COUNTY: 9.9
KITSAP COUNTY: 9.5
PIERCE COUNTY: 8.2
SNOHOMISH COUNTY: 6.3

While per-capita emissions increased only 2 percent since our 2015 baseline year, the population of Thurston County increased 6 percent over the same period, and total emissions increased by 7 percent.
3.2 Emissions Sectors

We can’t mitigate climate change if we don’t know what behaviors and choices need to change. What activities are contributing the most to our regional carbon footprint? The following sections describe key sectors in more detail to help identify our options to reduce regional greenhouse gas emissions and help to limit climate change impacts.

Buildings and Energy

When we turn on the lights, turn up the heat, or power up an appliance in our homes and workplaces, we are tapping some source of energy. The Buildings and Energy sector includes the generation, transmission, and distribution of electricity and natural gas for heating, cooling, lighting, and other uses. Greenhouse gases are released during the combustion of fossil fuels—such as coal, oil, and natural gas—to heat buildings and produce electricity.

- The buildings and energy sector is the greatest contributor to emissions in the Thurston region, accounting for around 57 percent of total emissions. Residential buildings are the largest source of emissions within this sector, followed by commercial and government buildings, industrial facilities, and outdoor lighting.
- Electricity accounts for the largest portion of this sector’s emissions—about 76 percent. Most Thurston County residents get electricity from Puget Sound Energy, and coal-fired power plants make up over a third of the utility’s current fuel mix (see sidebar).
- Natural gas is the second biggest portion of emissions at 21 percent, and a growing proportion. Other fuels such as fuel oil, liquid petroleum gas (LPG), and wood make up a much smaller part—about 3 percent combined.

Reducing emissions from this sector will require expanding renewable energy generation and use, as well as improvements in building materials and management that increase energy efficiency. Engaging and empowering individuals and organizations to make changes in the way they use energy can also lead to considerable reductions, and actions related to demand response can reduce energy emissions during peak times.
Greening Our Grid

Most people in the Thurston region get electricity from Puget Sound Energy, which uses a mix of different fuel sources to provide a reliable source of power to its customers. Hydroelectricity has long produced a portion of that energy mix, and renewable sources like wind are increasing, but fossil fuels like coal and natural gas still supply the majority of power to our electrical grid. This reliance on fossil fuels leads to the high levels of emissions we see from use of electricity in our building sector. (Note that Puget Sound Energy also supplies natural gas directly to customers for heating and cooking—this section only refers to natural gas that is part of the fuel mix for electricity.)

In 2019, Washington State passed the Clean Energy Transformation Act (CETA), which sets milestones for utilities such as Puget Sound Energy to transition toward a clean fuel standard. Under CETA, utilities must eliminate coal-fired electricity from their mix by 2025, become greenhouse-gas neutral by 2030 (using offsets, if necessary), and provide 100 percent renewable energy by 2045. Other recent state legislation lays out steps toward production of renewable natural gas and greater energy efficiency.

Supporting the transition of our electrical grid to clean energy is one of the most powerful things we can do locally to achieve our greenhouse gas reduction targets (see Chapter 6—Implementation Strategy).

**Figure 4.** Puget Sound Energy 2018 Electricity Fuel Mix. Source: Washington Department of Commerce and Puget Sound Energy
SUCCESS STORY:
Climate Change Mitigation by Increasing Efficiency and Equity

The Community Action Council of Lewis, Mason, and Thurston Counties is a regional non-profit whose Weatherization Program helps low-income households make their homes more energy efficient. Weatherization efforts can include weather-stripping and caulking to improve air seals, installing or replacing insulation, replacing windows, and similar repairs. The Weatherization Program helps these households decrease energy use by providing many services free of charge. This work also supports the health and safety of families by helping identify and repair heating system troubles and indoor air quality issues. Programs like this one reduce our local contributions to climate change while also increasing the distribution of resources among people who might otherwise find energy efficiency improvements out of their reach.
Transportation and Land Use

Moving people and goods efficiently is a key function of a thriving community. However, all that driving, and sitting in traffic, adds up to a big emission bill we’ll pay in climate impacts. The majority of greenhouse gas emissions from transportation result from the use of fossil fuel-based products, like gasoline, in internal combustion engines.

- Transportation is the second largest source of emissions in our region (32 percent). Passenger vehicles are the largest source of on-road emissions, followed by heavy duty trucks, and commercial vehicles.
- Regional transit options like buses and vanpools make up less than one percent of transportation-related emissions.

As the Thurston region continues to grow, low-emission transportation will become even more important. This will require that we drive less, telework more, use more fuel-efficient vehicles, and promote alternative forms of travel, like biking and walking. Focusing a high proportion of future development in urban centers and along major transportation corridors, and reducing sprawl can help support this transition.
SUCCESS STORY:
Climate Change Mitigation by Encouraging Public Transit

Increasing access to public transit is a strategy that has benefits beyond its climate impact. In 2020, both Intercity Transit and ruralTransit stopped charging for rides on their buses. Revenue from bus passes contributed a small percentage of Intercity Transit’s funding—less than 2 percent. In 2018, voters approved a local sales tax increase to improve transit funding, making bus fare effectively prepaid by local economic activity. Intercity Transit’s zero-fare program is a five-year demonstration project intended to both increase the efficiency of transit operation and reduce barriers to taking the bus. The strategy can also support climate mitigation, by making it easier for people to opt for a less-carbon intensive way to get around town, decreasing the number of polluting vehicles on the road. More than 75 percent of residents in our region support or strongly support zero-fare services, and in just the first month of the pilot project, Intercity Transit saw a 20 percent increase in ridership. Over the longer term, a zero-fare system can increase return on taxpayer investment, reduce congestion, and provide more equitable service to all, all while helping to reduce greenhouse gas emissions.
Water and Waste

As a rapidly growing region, the amount of water we use and waste we produce are also on the rise. Trash produced by Thurston County residents and businesses is sent to a landfill to decompose. During the decomposition process, solid waste produces methane—a gas that can be 84 times more potent than carbon dioxide during the first two decades after its release. If uncaptured, this leakage can be a primary source of greenhouse gas emissions from solid waste disposal. Waste collection, transportation, and processing require energy as well, which is often derived from the combustion of fossil fuels. There are similar emissions related to wastewater: wastewater must be collected, transported, treated, and released back into the environment—all of which requires energy and, in some cases, releases potent methane.

- In 2018, waste-related emissions contributed to a little over four percent of Thurston County’s total emissions. Methane leaks are often a major source of solid waste emissions—however, the Roosevelt Regional Landfill where most of Thurston County’s waste ends up is a leader in methane capture (see sidebar). Other solid waste emissions originated from processing and transportation of solid waste.

- The Thurston region has one of the most innovative wastewater treatment facilities in the country in the LOTT Clean Water Alliance. Wastewater treatment only makes up a small fraction of Thurston County’s total emissions (less than one percent). The largest sources of wastewater emissions were related to digester and methanol emissions—both of which are necessary in treating wastewater solids.

Diverting waste keeps materials out of landfills, where it would traditionally break down and produce greenhouse gases. Reducing the sources of waste is the most impactful way to cut the emissions associated with solid waste. Not only does source reduction decrease direct landfill emissions, it also can drive reductions in emissions associated with the manufacturing and transport of products and services. While these consumption-side emissions are not currently included in our inventory, incentivizing reduction, recycling, and reuse strategies can ultimately have a big influence on emissions.

Reducing water use also can reduce emissions generated from the energy used to pump water and wastewater. These emissions are typically included in the building sector totals discussed above, and they can be among the largest electricity demands for households and municipalities.
SUCCESS STORY:
Climate Change Mitigation by Improving Waste Processes

Reusing our excess waste can be a win-win mitigation strategy. The Roosevelt Regional Landfill in southern Washington is the destination for much of Thurston County’s trash. Since the late 1990s, it has generated power through a waste-to-energy project, and now has transitioned from generating electricity to renewable natural gas (RNG). The initial power plant at the landfill generated 26 megawatts of electrical power, or enough electricity to power more than 20,000 homes. In 2018, the Klickitat Public Utility District began investigating using methane from the landfill to generate renewable natural gas in partnership with Republic Services. In 2020, the PUD shifted entirely from electricity generation to the generation of RNG. Since methane is a powerful greenhouse gas, redirecting any methane emissions from the atmosphere can help reduce local contributions to climate change. By the end of the system’s 80-year lifespan, it will offset a total of 35.4 million tons of carbon dioxide emissions, and the land will be returned to agricultural use. The project generates more than 1.6 million dekatherms of renewable natural gas per year—a portion of which may circulate back to heat Thurston County homes through an agreement with Puget Sound Energy.
Agriculture and Forests

Farms, forests, and other open space are important to the identity of the Thurston region, and they can play an essential role in achieving our emission reduction targets by sequestering carbon and helping limit urban sprawl. While these sectors make up only a small proportion of Thurston County’s emissions (two percent), agricultural activities, forest practices, and land conversion can contribute greenhouse gas emissions in a variety of ways:

- **Deforestation** causes the carbon stored in trees to be released into the atmosphere. Deforestation also prevents trees from capturing more carbon from the atmosphere—a process known as carbon sequestration.

- **Land management practices** on agricultural soils can lead to increased concentrations of nitrogen in the soil and result in emissions of nitrous oxide (N2O), a potent greenhouse gas. Specific activities that emit N2O emissions include the application of synthetic and organic fertilizers and inefficient irrigation practices.

- **Livestock**, especially cattle, produce methane (CH4) as part of their normal digestive processes—another potent greenhouse gas. This process, called enteric fermentation, represents nearly half of the emissions from Thurston County’s agriculture sector.

- **Manure management** from livestock also emits potent methane and nitrous oxide gases. The amount of gases produced varies depending on the manure treatment and storage method.

- **Development of prairies** reduces opportunity for stored carbon and contributes to urban sprawl.

**Carbon sequestration** refers to the ability of plants, soils, and other organic material to capture and store carbon from the atmosphere. By planting trees, amending soils, and creating natural drainage systems with certain plant species, the Thurston region can remove carbon from the atmosphere and store it in plant matter and soils. Carbon sequestration strategies can bring other benefits as well. For example, adding organic matter to soil supports soil structure and microbiology, retains water, reduces erosion and stormwater run-off, and filters out pollutants. Carbon sequestration is not currently measured in the greenhouse gas inventory, so we don’t have a good baseline of the role it plays in our emissions picture. Improving our understanding of the mechanics of sequestration in our region will be an important next step in order to better assess the potential impact of new sequestration actions.
SUCCESS STORY: Climate Change Mitigation Through Farming Practices and Preservation

Thurston County loses more than 1,000 acres of farmland a year to other uses, yet this land is critical for our regional goals of maintaining a local food network, preserving open space and wildlife habitat, and offsetting local greenhouse gas emissions. This loss of local farmland forces us to source more of our food from outside our region, making our community more dependent on outside suppliers while increasing transportation emissions and undermining local food security. Programs that fund farmland preservation include the Washington Wildlife and Recreation Program, and Thurston County’s Conservation Futures and Transfer of Development Rights programs, which purchase property or development rights, allowing these areas to remain as open space available for farming. In 2017, Conservation Futures’ funding helped purchase an agricultural conservation easement for Oyster Bay Farm, permanently preserving 39 acres for future generations of food production. Preservation of working farmland will be essential to support both a reliable local food supply and climate mitigation.

Farmers also can make a positive contribution to climate change mitigation with the way they manage their land. In particular, regenerative agriculture is an approach to farming that aims to capture carbon in both soil and plants. It employs a suite of practices including no-till, managed grazing, and selective planting of crops and trees that also benefit local biodiversity and ecosystem health. These techniques are used at farms of all sizes and styles. Sapsucker Farm in Olympia makes the most of its six acres to raise a mix of sheep, cattle, turkeys, geese, and chickens by using rotational grazing, keyline water management, and a silvopasture system that will intersperse nut- and fruit-bearing trees with grazing areas—all with the goal of providing carbon-negative meat. Calliope Farm in the Littlerock area has 18 acres where they are working to build soil health and sequester carbon. Their vegetables grow interspersed with “harvest lanes” that help prevent soil erosion and create habitat for beneficial insects. In 2020, the Washington State Legislature established the Sustainable Farms and Fields grant program, which will aid farmers and ranchers in adopting practices that increase carbon storage. These resources allow families to continue farming land they have worked on for generations and provide Washingtonians with healthy local food and a diverse economy. Agricultural land preservation and the stewardship practices adopted by local farmers, including those profiles above, will play a key role in future climate solutions.
Cross-Cutting

Climate change poses a fundamental threat to the future health and well-being of our community and addressing it will require a strong response from across society. In addition to addressing specific local sources of greenhouse gas emissions, such as those described in the previous sections, success will depend on building the resources, expertise, and constituency within our community to carry out the change we need and amplify its impact. Through effective and strategic education, advocacy, monitoring, and policy development, the Thurston region can increase awareness of, participation in, and impact of climate mitigation efforts.
SUCCESS STORY:
Climate Change Mitigation Through Education

ClimeTime is a state initiative to develop literacy around climate science by providing resources and professional development to science teachers and other educators across Washington. The program is managed by the Washington Office of Superintendent of Public Instruction and carried out through education districts and community organizations across the state. To date, the Capital Educational Service District (#113), which includes Thurston County, has engaged more than 800 elementary, middle, and high school teachers through workshops, provided lessons on climate to youth in area detention centers, and developed an online course that can be used statewide. The curricula coming out of the initiative is targeted to support Next Generation Science Standards, such as that developed by the Pacific Education Institute, which centers its program on indigenous knowledge and empowering students to participate locally in solutions for reducing greenhouse gases.
Members of the Climate Advisory Workgroup assessed and prioritized actions during focus group meetings in fall 2019. Source: TRPC
4. Plan Development

“[The plan should] establish clear connections on how these actions impact climate change and have a positive impact on our environment.”

Interview with Lola Flores, Hispanic Roundtable

“Reduced carbon pollution should not be the sole measurement of success. [Criteria] needs to encompass the health of our environment and citizens now and in the future.”

Response to community questionnaire
The Thurston Climate Mitigation Plan is the result of more than a year of technical analysis and engagement with Thurston region stakeholders, including local governments, businesses, community organizations, and residents. An overview of this planning process is provided below.

### 4.1 Plan Development Framework

Several groups met regularly to inform and provide oversight of all aspects of the planning process:

- **Interjurisdictional Project Team.** This group consisted of lead staff from TRPC and each of the four partner jurisdictions: Thurston County and the cities of Lacey, Olympia, and Tumwater. The Project Team provided staff-level direction and coordination throughout the project, reviewed draft products, and facilitated development of the jurisdiction-specific implementation plans.

- **Consultant Team.** Seattle-based Cascadia Consulting Group and sub-consultant Hammerschlag LLC contributed technical support throughout the project, including developing the public engagement strategy and outreach materials, developing and analyzing actions, and quantifying emission reductions from those actions.

- **Climate Advisory Workgroup.** This committee included public- and private-sector members of the community with subject matter expertise in one of five sectors: Buildings and Energy, Transportation and Land Use, Water and Waste Management, Agriculture and Forestry, and Cross-cutting. The Climate Advisory Workgroup was tasked with identifying, evaluating, and recommending a list of impactful actions to achieve the emissions reduction goal. Workgroup members also reviewed and provided input on project goals and guiding principles, public engagement strategy, scenario results, and implementation strategies.

  On two occasions, members of the Climate Advisory Workgroup split into their five **Sector Focus Groups**, which included additional subject matter experts and interested members of the public. One round of the Sector Focus Groups included a meeting dedicated to youth and educator perspectives. All meetings of the Climate Advisory Workgroup were open to the public, and time for public comment was provided at each meeting.
• **Steering Committee.** The Steering Committee was composed of elected officials and staff from each of the four partner jurisdictions and was the decision-making body for the plan. This committee used a consensus-based decision-making process to approve each stage of the planning process. All meetings of the Steering Committee were open to the public, and time for public comment was provided at each meeting.

Each jurisdiction’s policymaking body (Board of Commissioners or City Council) will ultimately consider a resolution that accepts the *Thurston Climate Mitigation Plan* as a framework for future action and affirms the jurisdiction will further explore implementation of these strategies.
WHAT DO YOU THINK?

What actions or ideas should be included in the Climate Action Plan?

- STOP making zoos and trapping innocent animals for your enjoyment
- Carbon Farming
- More electric cars (or different fuels)
- More carpooling / carpool lanes
- Reduce water usage and conserve energy
- Expand recycling reduce plastics plant more trees
- Use goats to mow your lawn
- Increase the amount of things we can reuse / recycle locally
- Grow Hemp Industrially!
- STOP dumping garbage in the ocean and polluting the air
- More rural transit (bicycle)
- Less air pollution
- Tax gas hog vehicles
- Less wasted plastic within restaurants
- Tax businesses waste like Santa does
- Educate for population reduction = smaller family sizes
- Invent renewable energy sources, renewable water / wind, sustainable, recycle
- Alternative energies
- Address homelessness as to not pollute downtown
- Stop cutting down trees in our area and in developments
- More fans around the planet
- More gas savings
- innovative genius
don't use that much power
- Ride bikes
- Electric cars in stead of using gas
- Ferry frequent service to seattle
- reusable bags
- Your bike don't
4.2 Community Engagement

The benefits and costs of climate mitigation actions will affect everyone in Thurston County. Therefore, it was crucial to gather as many perspectives as possible to inform the plan. The following goals and objectives guided public engagement during the planning process:

A. Lay the groundwork for continued community engagement on climate action.
   ○ Deliver honest and consistent messaging to the public.
   ○ Build relationships with trusted community liaisons to help engage hard-to-reach populations such as communities of color, low-income, rural, youth, and elderly communities, and military families.
   ○ Provide a range of engagement options to suit different lifestyles, availability, and ways of processing information.

B. Promote alignment between community and government climate priorities, while recognizing the separate roles, responsibilities, and interests of individuals and organizations.
   ○ Solicit meaningful input from a diverse and representative set of partners and stakeholders.
   ○ Capture areas of convergence and divergence regarding climate action priorities throughout Thurston County, including gaps and unmet needs, where applicable.

C. Build public support for climate action across Thurston County.
   ○ Develop broad awareness of anticipated climate impacts throughout Thurston County and the cities of Lacey, Olympia, and Tumwater and efforts to address them, including the co-benefits of action and the costs of inaction.
   ○ Meet participants where they are, with respect for their involvement in climate change action and their different needs, wants, and priorities regarding climate mitigation.
   ○ Clearly describe the focus and boundaries of the Thurston Climate Mitigation Plan, how the plan is to be used, and the role that public input and informed decision making will play in plan implementation.

Input from the community was used to inform the development, refinement, and prioritization of actions in the draft plan. To ensure a robust engagement process across our region, the planning process included both broad and targeted engagement. Responses from the public are shown throughout this plan. A few of the methods used are summarized below—for a complete description of community engagement activities, see Appendix 10.8.
Community Questionnaire

In 2019, an online community questionnaire gathered a baseline understanding of the community’s priorities, perspectives, and concerns. The survey was shared through the TRPC website, social media, e-newsletters, listservs, and partner networks. The survey was open from August 12 to September 30, 2019, and received 1,397 responses.

Pop-Up Events

The Project Team engaged with the community at local events, including Tenino Oregon Trail Days; Thurston County Fair; the Yelm, Olympia, and Tumwater Farmers Markets; Tumwater Brewfest; and the Olympia Fall Arts Walk, among others. These pop-up events provided an opportunity for visitors to learn more about the project, ask questions to project staff, and provide input through interactive activities.

Presentations

The Project Team gave presentations to a number of committees and organizations. These presentations gave an overview of the project and an opportunity to provide high-level recommendations for the plan’s development. In addition to regular updates to City Councils and the County Commissioners, presentations were given to the South Thurston Economic Development Initiative (STEDI), Olympia Master Builders, Deschutes Estuary Restoration Team, Tumwater Tree Board, and Lacey Youth Council, among others.

Interviews

To better understand the impacts of the strategies and actions being considered, the Consultant Team conducted interviews with representatives from key sectors and organizations. Interview subjects included representatives from the Thurston County Food Bank, Confederated Tribes of the Chehalis Reservation, Olympia Master Builders, Hispanic Roundtable, and Homes First. Interviewees provided feedback on their organization’s climate impact mitigation work; climate impacts to the communities in which they work; as well as concerns, challenges, and potential barriers to implementation of the actions.

Tumwater city staff host an information booth at Tumwater Brewfest in August 2019.
Source: City of Tumwater
Key Themes from Early Community Outreach

• Across outreach methods, participants showed the broadest support for Buildings and Energy sector actions. Whether prioritizing focus areas, investing fictitious money, or choosing the personal actions they would like to take, survey respondents showed the broadest support for actions to shift to more renewable and clean energy sources, and to make buildings more energy-efficient and carbon-smart. This includes exploring incentives, subsidies, and mandates to encourage renewable energy; investing in renewable energy; and improving building energy-efficiency.

• Transportation and Land Use actions were a focus at public events and of actions people would like to take. At public events, actions to support transportation and land use were the overwhelming choice. Ideas included investing in bicycle and pedestrian facilities, electric vehicles, and public transit, and encouraging high-density areas that improve resource sustainability and efficiency. Similarly, two of the four most popular actions survey respondents said they would like to take are purchasing or driving an all-electric vehicle (48 percent) and driving a high-efficiency vehicle (25 percent).

• The individual actions of greatest interest to survey respondents are those the Thurston Climate Mitigation Plan could support: These include investing in solar panels for home or business (57 percent), purchasing or driving an all-electric vehicle (48 percent), participating in a renewable energy program through local utility (30 percent), and driving a high-efficiency vehicle (25 percent).

• People favored balancing multiple goals when identifying priority actions. Impact (how much carbon pollution will be reduced) was considered the most important driver of action.

• Priority focus areas and the most important drivers of action varied by factors like age, where survey respondents lived, and their income.

There will be additional opportunities for community engagement during the review of the draft plan, and as individual jurisdictions work to implement actions in the years to come.
4.3 Communitywide Action List

The Thurston Climate Mitigation Plan includes a list of communitywide actions to reduce greenhouse gas emissions in order to meet the adopted emissions reduction target. The planning process began by compiling a comprehensive initial list of potential strategies and actions. Between May and September 2019, the Project Team and Consultant Team gathered ideas from the Climate Advisory Workgroup, Steering Committee, sector focus groups, survey respondents, general public, and other climate planning efforts to develop a list of over 300 potential actions to reduce greenhouse gas emissions. Contributors also provided details on likely partners, resources, funding opportunities, and barriers to implementation.

If you had $1,000 dollars to invest to reduce carbon pollution, how would you spend it?

- Make our homes, businesses, and other buildings more energy-efficient and carbon-smart, for example through energy retrofits, energy-saving appliances, and sustainable... $337.78
- Reduce consumption and waste by recycling and composting more, avoiding single-use items, and repairing or retrofitting instead of buying new. $190.46
- Increase urban density, for example with accessible public transportation, mixed use buildings (e.g., retail on the bottom floor and residences above), and affordable housing. $214.85
- Store more carbon in trees, plants, and soil, for example by preserving large trees, increasing tree canopy, and managing soil for carbon storage in addition to other benefits. $275.27
- Increase the use of alternative forms of transportation, such as riding the bus, walking, carpool, vanpool, and biking, as well as more fuel-efficient vehicles. $242.91
- Shift from fossil fuel-powered to more renewable and clean electricity sources (e.g., from coal to wind/hydro/solar energy). $340.78

Responses to Climate Mitigation Community Questionnaire, September 2019.
4.3 Communitywide Action List

The Thurston Climate Mitigation Plan includes a list of communitywide actions to reduce greenhouse gas emissions in order to meet the adopted emissions reduction target. The planning process began by compiling a comprehensive initial list of potential strategies and actions. Between May and September 2019, the Project Team and Consultant Team gathered ideas from the Climate Advisory Workgroup, Steering Committee, sector focus groups, survey respondents, general public, and other climate planning efforts to develop a list of over 300 potential actions to reduce greenhouse gas emissions. Contributors also provided details on likely partners, resources, funding opportunities, and barriers to implementation.

This initial list of actions was refined and consolidated, resulting in a list of 242 actions addressing a wide variety of sectors and strategies. While the shorter list of actions assessed for this draft plan focuses on where local government can play a leading role, addressing the causes of climate change will require action from the state and partners throughout our community—including the private sector, nonprofits and nongovernmental organizations, and individuals. The complete list of actions is full of great ideas that can and should be taken up by others seeking to create change; it is available in Appendix 10.3.
Prioritizing Actions

To focus time and resources on actions that could best achieve the goals set for this process, the project partners narrowed the long list of actions using a multicriteria analysis. The Consultant Team, Climate Advisory Workgroup, and technical experts assessed each action against four criteria: impact on greenhouse gas emissions, speed of deployment, local control, and community co-benefits. Stakeholders reviewed and discussed the outcomes from this multicriteria analysis to arrive at the priority actions assessed for this draft plan (see Chapter 5—Strategies & Actions). For a thorough description of the multicriteria analysis, see Appendix 10.4.

Figure 5. Criteria Used to Prioritize Actions for the Thurston Climate Mitigation Plan
4.4 Emissions Target Analysis

The next step was to understand what it would take to reach the adopted greenhouse gas emission reduction targets, and whether the actions we prioritized would do enough. The Consultant Team developed a tool to display the impacts of climate policies on future emissions. Their analysis, summarized below, shows that the emissions reduction targets adopted by the four partner jurisdictions are ambitious, but achievable. For a thorough discussion of the Scenario Analysis, see Appendix 10.5.

“Business as Usual” Scenario

This analysis began by assessing the amount of emissions we can expect if energy and climate policies remain fixed as they were in 2018. This “business-as-usual” scenario looked at how greenhouse gas emissions for the Thurston region would grow between now and 2050, with our anticipated population growth and no new climate action at the federal, state, or local level.

The “business-as-usual” scenario projects that without any action, our local emissions will grow by more than 760,000 metric tons of greenhouse gases over the next 10 years—a 26 percent increase from 2015 (see Figure 6). By 2050, that footprint could grow again by half—more than a million additional tons of greenhouse gases each year, compared to where we are today. This upward trajectory is tied to anticipated population growth, and it would put current and future residents of the Thurston our region on the path to experiencing the most severe impacts from climate change.

Figure 6. Thurston County Projected Greenhouse Gas Emissions: Business as Usual Scenario, 2015-2050. The dotted line shows the adopted emission reduction targets. Rather than decrease, without action locally generated greenhouse gas emissions are predicted to increase by 50 percent by 2050.
State Policy-Adjusted Scenario

The Consultant Team then assessed how recent federal and state actions will contribute to local greenhouse gas emission reductions over the next 30 years. This “policy-adjusted forecast” estimated the impact of the following recently adopted state laws:

- **Updates to Washington State Building and Energy Code.** Code changes that were set to go into effect in 2020 will significantly increase energy performance requirements for new residential and commercial buildings. In June 2020, the Washington State Building Code Council voted to extend the effective date of the new standards to February 1, 2021. This extension was not reflected in the Consultant Team’s analysis.

- **Clean Energy Transformation Act (CETA).** State legislation adopted in 2019 requires that electric utilities operating in the state eliminate coal as a fuel source by 2025, and source 100 percent of the electricity they supply to Washington customers from renewable and non-greenhouse-gas-emitting resources by 2045.

- **Low-Emission Vehicle Standard.** State legislation adopted in 2018 requires that vehicles sold or licensed in Washington State must meet the same emissions standards as those set by the California Air Resources Board (CARB). CARB standards require efficiency increases of 3.7 percent each year from 2020-2026, resulting in a similar standard as the Obama-era Corporate Average Fuel Economy (CAFE) rule. Additional state legislation passed in 2020 extends these requirements to medium-duty trucks. The state Low-Emission Vehicle Standard currently is unaffected by the Trump administration’s replacement of the CAFE standards with lower federal efficiency requirements.
• **Zero-Emission Vehicle Standard.** State legislation adopted in 2020 requires car manufacturers selling vehicles in Washington State to follow California’s zero emission vehicle (ZEV) standards here as well. An increasing portion of vehicles provided for sale in Washington State must be ZEV, or car manufacturers may obtain credits equal to that portion.

There are additional actions happening at a state level that will affect local emissions, directly and indirectly. This analysis was not intended to provide a comprehensive account of the potential impact of all state actions. The Consultant Team highlighted those that seemed most likely to directly affect the Thurston region’s largest emission sectors.

As shown in Figure 7, state action can have a large impact on emissions from Thurston County. Taken together these four policies could reduce emissions by nearly half (46 percent) by 2030, when compared with the “business-as-usual” scenario—and by nearly two-thirds (64 percent) by 2050. In particular, the Clean Energy Transformation Act (CETA) can play a critical role in reducing emissions in the near-term, by removing coal as a source of Thurston County’s electricity by 2025, and fully transitioning our electrical grid to clean energy sources by 2045. These changes will dramatically reduce emissions from the building sector, currently our region’s largest source of emissions. If implemented as intended, electricity will go from contributing almost half of our local emissions (43 percent) to contributing zero.

Figure 7. Potential Reduction in Thurston County Emissions from State Policies. The dotted line shows the adopted emission reduction targets. Source: Hammerschlag 2020
By comparison, building code changes and increased fuel efficiency will take longer to impact emissions—which is because it will take time for people to trade up for newer, more fuel-efficient cars, and even longer to replace our current building stock with new or remodeled energy-efficient structures. These improvements play an increasingly important role as we look out toward achieving our 2050 goal.

Local Action Scenario

After evaluating the impact of state policies, the Consultant Team estimated how local actions can close the remaining gap and put our region on track to a 45 percent reduction in emissions by 2030 and an 85 percent reduction by 2050. Using the list of actions prioritized in the multicriteria analysis, they assessed how those actions could work together to affect different greenhouse gas contributors (see Table 1).

These pathways assume that each assessed action is feasible and will be completed with the full support of local and state officials and other relevant partners. In many cases, the emission reductions, which were estimated by the Consultant Team, will require a significant level of focus and sustained commitment from local partners.

Figure 8 shows how this suite of local actions, when paired with state policies, could reduce emissions enough to meet our target. While all the actions identified play a part, a few strategies stand out as bringing about the most substantial reductions. These include strategies that:

- reduce natural gas use
- reduce the amount that people drive and increase fuel efficiency for when they do
- store additional carbon in soil and plants

Table 1. Estimated Impacts of Assessed Actions on Various Greenhouse Gas Emission Sources. Source: Hammerschlag 2020
It is important to note that this analysis only considers the potential for certain policies and actions to reduce greenhouse gas emissions—it does not weigh the impact those actions may have on other important factors, such as any additional cost to consumers of energy or housing. It does not look at how the costs and benefits of the actions are distributed to different people within our community, and whether those costs or benefits would accrue disproportionately to some people over others. These factors are considered elsewhere in this plan and can and should be considered as the project partners move ahead and determine how to take action.

In addition, this analysis presents just one of many possible pathways for reducing greenhouse gas emissions. New discoveries, technologies, or legislation at the state and federal level could dramatically change the picture, and that uncertainty increases as we look ahead ten and twenty years. For example, a clean fuel standard that significantly reduces the carbon intensity of vehicle fuels could have an impact on local transportation emissions similar to that of CETA on local building emissions, reducing the amount of local investment needed in sequestration or other actions.

NOTE – September 2020:

As this draft was about to be released for public review, a reviewer identified an error in the formula used to calculate the 2050 estimate of sequestration. The corrected estimates are about five percent lower than the 2050 estimates shown in the draft. This error will be corrected in the final version, when other public comments are addressed. The correction may change the estimates in the scenario analysis.

Figure 8. Potential Reduction in Thurston County Emissions from State Policies and Local Actions. The dotted line shows the adopted emission reduction targets. Colored wedges show reduction to individual emissions sectors. Reductions in the agriculture sector are too small to be visible, the hashed area shows offsets from actions that increase carbon sequestration. Source: Hammerschlag 2020
Despite these caveats, looking at these potential futures led to some conclusions that guide the priorities laid out in this plan:

- **Our adopted emission reduction targets are achievable, but only with significant attention on many fronts.** No single action will reduce local emissions enough to reach our targets; local governments will need to show leadership across many different programs to meaningfully address climate change.

- **State action will play a large role in our ability to achieve our targets.** Recent legislation, especially the Clean Energy Transformation Act, is helping to bring our emission reduction targets within reach. Our ability to achieve that goal is dependent on those rules being rolled out as envisioned.

- **Electricity is an ally.** Today, electricity use is our largest source of local emissions. With a cleaner electrical grid, that picture changes completely. Additional reductions are possible by shifting more uses to that greener power source. This means transitioning away from heating and cooking with natural gas and accelerating the adoption of electric vehicles.

- **Transportation is where local government action can affect the largest reductions.** While the building sector is our largest source of emissions today, those sources will be substantially reduced by state legislation. That leaves transportation as the area where the attention of local governments can make the biggest difference, by influencing what, where, and how much people drive.

- **Land use and building code changes will be more important over the long term.** The benefits of these changes will take longer to observe, but they need to be put in place in the near term to enable the urban density, bicycle and pedestrian networks, and greener buildings that are critical to achieving the 2050 target.

- **Carbon sequestration will need to be a part of the package.** Without new technology or state or federal action, even aggressive local action to reduce emissions may not be sufficient to achieve our longer-term 2050 target. To succeed, we’ll need to tap the potential carbon-storing potential of local farms and forests, and we’ll need to consider the role existing trees and other habitats serve in sustaining our climate.

- **Good data can help us better understand how individual actions translate to emission reductions.** The scenarios described in this section estimate future emissions based on general assumptions about how certain actions could affect human behavior in the future. This was the best information available at the time this plan was being developed, and it simplifies the complex interactions of the world. We will need to identify and gather more specific data to track and reflect the real outcomes of our actions, in order to truly understand where we lag and where we are making progress. This is particularly true for the assumptions around the potential to offset emissions through sequestration.
What We Heard...

“Work with current partners, build on what already exists, leverage all assets and skills, create a phased approach with clear deliverables. But in the end do something.”

Interview with Robert Coit, Thurston County Food Bank

“[Housing, transportation, and access to services that address the needs of low-income families and individuals should be a major part of the climate justice plan.]

Community Questionnaire

“Listen to the teenagers. They’ll be the ones to suffer if we don’t act.”

5. Mitigation Strategies and Actions

“In the fight against climate change, cities and counties have become important leaders because of their role as laboratories, incubators, and implementers of climate solutions. Because local governments can be more responsive than those at the state and federal levels, and because and they are so, cities are playing a prominent role on the international stage in galvanizing climate action.”

Center for Climate and Energy Solutions
The Thurston Climate Mitigation Plan lays out a framework of strategies and actions to put Thurston County and the cities of Lacey, Olympia, and Tumwater on track to reach the 2050 goal of an 85 percent reduction in greenhouse gas emissions.

5.1 Chapter Organization

This chapter is structured around three levels: sectors, strategies, and actions.

Sectors

The strategies and actions are grouped to address the emissions sectors described in Chapter 3—Background:

- Buildings and energy
- Transportation and land use
- Water and waste
- Agriculture and forests
- Cross-cutting

Strategies

Strategies are methods or pathways to address a particular sector. The strategies form the frame of our plan, providing a structure for future action. They lay out the broad routes we’ll use to achieve our vision for climate mitigation over the next 30 years.

Assessed Actions

The assessed actions listed below each strategy are potential means to address that strategy and emissions sector. They are the launching point for the partner jurisdictions as they develop specific work plans. Jurisdictions may opt how and whether they implement these actions, and they may be modified as those implementation strategies are developed in detail.

These actions emerged as priorities from the full list of potential climate mitigation actions proposed by stakeholders and community members (Appendix 10.3). They include those that rose to the top of the multicriteria analysis overall, as well as actions that address key sectors or strategies identified as important by members of the Climate Advisory Workgroup and Steering Committee. The impact icons next to each action show how it ranked for several categories in the multicriteria analysis (Appendix 10.4). To find out how these actions combine to help meet the goals of the Thurston Climate Mitigation Plan, review the results of the scenario analysis in Chapter 4—Plan Development and Appendix 10.5.
Relationship Between Sectors, Strategies, and Actions

This plan lays out a framework for climate mitigation over the next 30 years, based on our best understanding today. As the plan is carried out, we anticipate that sectors and strategies will largely persist as the backbone of that framework, while the actions needed will change over time as some actions are completed or found to not be feasible or desirable, and as new actions are considered.

Targets and Indicators

Performance measures can help us track whether we are making progress toward our climate mitigation goals and determine whether our actions have been effective. Each sector includes one or more targets based on the scenario analysis described in Chapter 4—Plan Development. To track progress for some strategies, we may need to set supplemental targets as part of the longer-term monitoring of the plan. Key performance indicators are the quantitative metrics that measure progress toward the targets over time. Targets and indicators are part of the monitoring and evaluation plan included in Appendix 10.7.

Considerations for Implementation

This section summarizes potential opportunities, obstacles, barriers, or tradeoffs raised throughout the process that we should consider as we move into implementation.

**Assessed Action Details**

Actions listed below each strategy are potential means to address that strategy and emissions sector.
Greenhouse Gas Reduction Potential
The estimated annual quantity of greenhouse gas emissions an action will avoid or sequester as of 2030. This measure was the most important factor used to identify priority actions.

- **High**: Addresses a large emissions source (e.g., energy use or transportation), has broad reach, and high enforceability.
- **Medium/High**: Addresses a large emissions source, but relies on voluntary action.
- **Medium**: Addresses a large emissions source, but has limited reach.
- **Medium/Low**: Addresses a small or unmeasured emissions source (e.g., agriculture, solid waste), and has broad reach or high enforceability.
- **Low**: Addresses a low emissions source, and has limited scope or enforceability; or lays the foundation for other actions, although it may not reduce emissions directly.

WHAT THE ICONS MEAN

Co-Benefits
Nearly all the assessed actions support one or more of the Regional Goals adopted for this planning process (see Chapter 2). The icons below indicate an action’s potential benefits to the community, in addition to its ability to address emission sources.

- **Ecosystem Health**: Supports the protection and preservation of environmentally sensitive species and lands, open space, water quality and water supply, or air quality. Regional Goals 2, 4, 8, 10
- **Adaptation Value**: Supports an action in the Thurston Climate Adaptation Plan.
- **Social Equity**: Supports the equal distribution of resources among historically disadvantaged or marginalized communities. Regional Goal 6
- **Other Regional Goal**: Supports another regional goal, including vibrant city centers and corridors, zero waste, or education. Regional Goals 1, 5, 11
- **Economic Benefit**: Supports local prosperity, including through investments, markets, and jobs. Regional Goals 3, 7, 12
- **Youth Priority**: As the generation who will be tasked with adapting most to climate impacts, youth voices have had a strong influence on this planning process. These actions were identified as important by a team of students and educators as part of the multicriteria analysis.
### 5.2 Buildings & Energy Sector

**Strategy B1. Reduce energy use in existing residential buildings.**

Residential energy use currently is the largest source of greenhouse gas emissions in our region. While newer buildings may be constructed to meet greener standards, the majority of homes in Thurston County were built before 1988, with one in five dating back 50 or more years. Looking at our emission reduction targets, more than two-thirds of the housing units that will exist in 2050 already exist today, so retrofitting existing buildings is a key strategy. While energy efficiency improvements can pay for themselves over time through reduced heating and cooling expenses, the upfront cost may be a barrier for many. More than a third of homes in Thurston County are rented, which means their occupants may have less control over choosing appliances or making building improvements that increase efficiency. The actions described below will support a transition toward higher efficiency homes by providing more information to consumers about home energy use and incentives for efficiency upgrades.

</tr>
</tbody>
</table>
**Strategy B2. Reduce energy use in existing commercial/industrial buildings.**

Energy used to power businesses contributes to more than a quarter of our local carbon footprint (26 percent). Operations range from small retail and professional offices to sprawling warehouses. Improving efficiency across this sector will require approaches that target these different scales. The Thurston region currently has more than 42 million square feet of commercial and industrial area, but it is distributed unevenly. The greatest proportion of commercial building area is in the city of Olympia, while industrial space is concentrated in Lacey and Tumwater. As home to the headquarters of many state agencies, Thurston County’s stock of office space includes a large share of public sector buildings—these organizations can show leadership by increasing efficiency and reduce long-term energy costs to taxpayers. While it is hard to predict our future needs for work space, commercial and industrial buildings must be adapted over the coming decades to help reduce greenhouse gas emissions and accommodate the more than 50,000 new jobs anticipated to be added in our region between now and 2045.

Potential Impact:
- Greenhouse Gas Reduction Potential
- Ecosystem Health
- Social Equity
- Economic Benefit
- Adaptation Value
- Other Regional Goal
- Youth Priority
Strategy B4. Reduce energy use in new construction or redevelopment.

To meet the needs of a growing population, our region will add approximately 30,000 new housing units by 2030 and nearly 55,000 new units by 2050, as well as around 23 million square feet of additional commercial and industrial space. Standards for energy efficiency in new development are generally set by the State Building Code Council, and requirements scheduled to go into place in 2020 set stricter emissions thresholds for most new buildings. Developers can incorporate greener practices more easily in new construction than existing structures, but such requirements can increase upfront costs—incentives and tools like the actions listed below can help to encourage the adoption of green building practices while balancing the need to keep housing affordable and local business costs down.

<table>

Strategy B5. Increase the production of local renewable energy.

Shifting our reliance for electricity away from polluting fossil fuels toward renewable sources like wind and solar power is one of the most important strategies we have to reduce emissions. Action at the state level, with the adoption of the Clean Energy Transformation Act, will move us a long way toward this end, but smaller-scale installation of renewable energy infrastructure can help support the transition as well, while saving ratepayers money over time and increasing local resilience. As of 2020, more than a thousand residential customers and over 60 businesses in Thurston County have installed solar panels that feed into the power grid, generating nearly 10 million kilowatt hours each year. The actions identified below are intended to set the stage for broader access to this technology.

What We Heard...

“Approve more options for very small, well-designed, affordable housing using incentives to cultivate interest by builders to construct.”

Response to community questionnaire
**Strategy B6. Convert to cleaner fuel sources.**

Greening our electrical grid is essential to achieving the climate targets, but electricity is not our only fuel source. Although it has a reputation for being “cleaner than coal,” natural gas also contributes to climate change, particularly by leaking methane, a powerful greenhouse gas far more potent than carbon dioxide, although less prevalent. Natural gas also can affect both indoor and outdoor air quality, causing impacts to public health. Approximately 32 percent of Thurston County households rely on natural gas as their primary source of heat at home. Across the partner jurisdictions, that proportion is highest in Lacey (45 percent), although the greatest number of households that use natural gas are in unincorporated Thurston County (12,487 homes). Actions assessed for this plan would restrict new natural gas connections and encourage those with existing connections to shift to cleaner options.

Buildings and Energy Sector: 
TARGETS AND INDICATORS

TARGETS
Baseline Year: 2015

• Reduce residential and commercial electricity consumption by 20 percent by 2030 and 30 percent by 2050.
• Reduce industrial electricity consumption by two percent by 2030 and five percent by 2050.
• Reduce residential and commercial natural gas consumption by 20 percent by 2030 and 50 percent by 2050.
• Reduce industrial natural gas consumption by ten percent by 2030 and 30 percent by 2050.
• Reduce residential consumption of other fuels (liquid petroleum gas, wood) by ten percent by 2030 and 20 percent by 2050.

KEY PERFORMANCE INDICATORS

• Annual residential, commercial, and industrial electricity consumption
• Annual residential, commercial, and industrial natural gas consumption
• Residential energy use per capita
• Commercial energy use per square foot

SUPPLEMENTAL PERFORMANCE INDICATORS

• Proportion of housing units with electric heat
• Grid-supplied renewable electricity
• Number of energy efficiency upgrades
• Proportion of households cost-burdened by energy and housing costs as a percentage of household income
Buildings and Energy Sector: CONSIDERATIONS FOR IMPLEMENTATION

The Thurston region is experiencing rising home prices and a severe lack of affordable housing. Actions taken to reduce emissions from the building sector must be designed with consideration of their impact to the cost of housing. Local builders already face a steep learning curve changing their practices in response to the new requirements of the state Building Code and a lack of local markets for some newer materials. A concern is that additional, restrictive requirements will favor large chains over local builders and contractors, who will be less able to purchase greener construction materials at scale.

The Clean Energy Transformation Act’s push toward clean sources for electricity can dramatically reduce emissions from the building sector, but the tradeoffs include the need for new energy infrastructure and the potential for higher energy costs. Locally, we can best support that transition by increasing energy efficiency of our building stock, particularly in lower income and senior households, and by enabling streamlined permitting for projects that support the energy grid of the future. This may include establishing clear expectations for when renewable energy infrastructure conflicts with other community priorities, such as tree preservation. The most efficient way to shift our grid will likely involve large scale renewable energy infrastructure in other areas of the state and county, however, advancing more locally distributed renewable energy sources can help support local resilience and independence.

Actions that focus on changing price signals through subsidies and incentives must carefully consider their potential impacts. Property tax and permit fee reductions reduce revenue sources that fund schools and support staff, undercutting our ability to develop local expertise. Incentives must be designed by first understanding what market or social factors create barriers to developing more energy efficient buildings. Such programs should be targeted to benefit disadvantaged groups, or to projects that go above and beyond to set a model for others. Pilot programs that begin through incentives can lay the groundwork to understand where regulatory requirements can be most effective.
5.3 Transportation and Land Use Sector

Strategy T1. Set land use policies that support increased urban density and efficient transportation networks and reduce urban sprawl.

When people opt to live close to the places they work, shop, and meet up with others, they make fewer, and shorter, driving trips—this is how increased density leads to reduced greenhouse gases. Planning for more compact growth in urban centers supports many of our regional goals, by making our cities and neighborhoods more vibrant, creating a robust economy, and reducing development pressure on environmentally sensitive areas. This strategy reinforces other approaches for reducing transportation emissions, by improving the viability of transit and making it safer and easier to get around by foot or bicycle.

The land use vision set out in Sustainable Thurston includes the following targets:

- By 2035, 72 percent of all (new and existing) households in our cities, towns, and unincorporated urban growth areas will be within a half-mile (comparable to a 20-minute walk) of an urban center, corridor, or neighborhood center.
- By 2035, at least 17 percent of homes in Lacey, Olympia, and Tumwater’s urban areas will be located in an urban corridor or center.
- Between 2010 and 2035, 5 percent of new housing will locate in the rural area.

As of 2019, our region is not on track to achieve these targets. The concentration of housing within walking distance of urban centers and corridors has stalled around 46 percent, although recent development in downtown urban areas is pointing the way toward increases in density.

Strategy T2. Increase efficiency of the transportation system.

The minutes spent waiting in traffic can add up to a substantial climate impact. Actions that improve congestion on our roads, either through investments in transportation infrastructure or by reducing the number of people driving at peak periods, will reduce emissions while also improving air quality and the ability of people and goods to get where they need to go.

- Social Equity
- Economic Benefit
- Adaptation Value
- Other Regional Goal
- Youth Priority
Strategy T3. Increase adoption of electric vehicles.

As our energy sources become cleaner, with electricity coming mostly from renewables, vehicles powered by gas and diesel will become our greatest local source of emissions. One of the easiest shifts we can make is to also power our transportation using electricity. As of April 2020, Thurston County has 2,162 registered electric vehicles or EVs. This number will need to increase substantially over the coming years to make a dent in transportation emissions. At the state level, the Zero Emission Vehicle standard adopted in 2020 will likely push auto companies toward offering a greater range of electric vehicles to consumers. Even as new EVs become more prevalent at dealerships, we know that generally one-third of the miles traveled in an average year in our region are driven in vehicles that are more than ten years old. The actions assessed for this plan will help set the stage locally for greater adoption of EVs by reducing technical and economic barriers.

<table>

<tr>
<td>T3.11 EV education. Partner with environmental and other agencies to increase consumer awareness about EV options and incentives for use and purchase</td>
<td><img src="0" alt="Y" /> ![A](E O S Y)</td>
<td><img src="0" alt="Y" /> ![A](E O S Y)</td>
</tr>
</tbody>
</table>
T3.14 EV mass purchase discounts. Create a group purchase program for residents to get deep discounts on EVs, other fuel efficient and alternative fuel vehicles.

T3.15 EV purchase incentives. Partner with car sale and lease dealerships to provide incentives for purchase of electric vehicles by Thurston County residents. Look to establish pilot programs with those neighborhoods, individuals with greatest VMT potential.

Strategy T4. Increase the use of public transit.
Public transportation connects people with jobs, school, healthcare, and community services in ways that are more carbon efficient than driving alone. Applying many of the actions assessed for this strategy, Intercity Transit’s 2019-2024 Strategic Plan predicts a minimum 40 percent increase in ridership in the next five years. Continued investment in transit will most aid those who don’t have access to other forms of transportation due to disabilities, age, or income, but also brings broader community benefits, such as better access to employment, workforce recruitment, and improvements in air pollution.

T4.1 increase transit. Increase local public transit routes/frequency with a focus on expanding transit service before and after traditional business hours and on weekends.

T4.3 rural transit. Identify and implement first/last mile solutions for rural ridership (engage rural homeowners associations for representation and feedback).

T4.4 fareless system. Maintain a fareless system for public transit.

T4.10 rider education/benefits. Maintain and expand a regional online page that lists all the mode shift education efforts and employer benefits opportunities (Thurston Here-To-There). Include a comments section for suggestions to further transit education and ridership.

T4.15 promote transit benefits. Work with employers and transit agencies to develop ways to incentivize employee ridership (ex. rebates for employees who give up use of employer parking facilities).
Strategy T5. Increase use of active forms of travel (such as, bicycling, walking).

Currently, most Thurston County residents drive alone to work and use a car for most other trips. While many residents enjoy walking and bicycling for recreation, just three percent of commute trips are made using these active modes. Making it easier for people to walk and bike for typical errands, rather than driving a car, will help reduce emissions while also supporting our regional goals and improved public health. These actions can benefit low income and other marginalized communities by reducing the need to rely on a private vehicle. The actions identified below will help address gaps and barriers in our current network.

What We Heard...

"More incentives to bike. More protected bike lanes along with improving the existing network of trails/current bike lanes.”

Response to community questionnaire
Transportation and Land Use Sector: TARGETS AND INDICATORS

TARGETS

Baseline Year: 2015

- Reduce vehicle miles traveled in passenger vehicles by five percent by 2030 and 20 percent by 2050.
- Reduce vehicle miles traveled in light-duty trucks by ten percent by 2030 and 15 percent by 2050.
- Reduce vehicle miles traveled in heavy-duty trucks by 20 percent by 2050.
- Increase average fuel efficiency of passenger vehicles by 20 percent by 2030 and 60 percent by 2050.
- Increase average fuel efficiency of light-duty trucks by ten percent by 2030 and 40 percent by 2050.
- Increase average fuel efficiency of heavy-duty trucks by ten percent by 2050.

KEY PERFORMANCE INDICATORS

- Vehicle miles traveled
- Average vehicle carbon intensity

SUPPLEMENTAL PERFORMANCE INDICATORS

- Percent of residents who live within a half mile of a corridor or transit line
- Number of public transit passenger boardings
- Number of registered electric vehicles
- Number of public electric vehicle charging stations
- Proportion of vehicle trips made using modes other than driving alone (walk, bicycle, transit, carpool)
- Median household transportation costs as a percentage of median household income
Transportation and Land Use Sector: CONSIDERATIONS FOR IMPLEMENTATION

The transportation strategies included in this framework use different levers for reducing emissions: some rely on changing the conditions in which people behave, others rely on people deciding to change their behavior. Increasing the adoption of electric vehicles, for example, allows people to reduce their carbon footprint without substantially changing the amount that they drive alone. Actions that focus on reducing vehicle miles traveled, in contrast, rely on people behaving in different ways than we see today, by living in denser communities and choosing to walk or take the bus instead of driving. In implementing these actions, we will need to consider who benefits from these strategies and ensure we are distributing those benefits equitably and where they will make the most sense. Actions that focus on creating a denser transportation network have many community co-benefits, increasing equity and access, but only if implemented in a way that does not lead to higher costs that drive lower-income families farther away from the urban center. Actions to support electric vehicles may be best targeted for residents in rural communities where mass transit is not an efficient option to reduce emissions. Incentive programs could be targeted to benefit low income or other disadvantaged groups, although reducing their audience may reduce the scale of emissions they reduce.
5.4 Water and Waste Sector

Strategy W1. Increase the efficiency of water and wastewater infrastructure.

Strategy W2. Reduce water consumption.

While water and wastewater management contribute only a small piece of our regional greenhouse gas inventory, the energy used to power these utilities are large contributors to the carbon footprint of individual jurisdictions. The actions identified below center on ways for city and county governments to reduce waste and save money, while reducing their own emissions.

**Strategy W4.** Divert more solid waste from landfills.

**Strategy W6.** Reduce consumption of carbon-intensive goods and services.

Although emissions generated outside Thurston County by manufacturing and transporting goods consumed here are not measured as part of our current inventory, many people involved in developing this plan were interested in addressing the impacts of consumption and waste. In *Sustainable Thurston*, our region set a goal to move toward zero waste, but currently, we are not on track to meet this goal. Waste collected on a per capita basis has increased from a low of 1,140 pounds per person in 2012 to 1,318 pounds per person in 2016.

<table>

Water and Waste Sector: TARGETS AND INDICATORS

TARGETS
Baseline Year: 2015

- Reduce emissions from wastewater treatment by 20 percent by 2030.
- Reduce solid waste generated per capita by 10 percent by 2030 and 30 percent by 2050.

KEY PERFORMANCE INDICATORS

- Tons of waste disposed to landfill
- Annual emissions from wastewater treatment

SUPPLEMENTAL PERFORMANCE INDICATORS

- Proportion of disposed waste that is compostable
- Number of septic tanks
Water and Waste Sector: CONSIDERATIONS FOR IMPLEMENTATION

A first step for this sector will involve reviewing the assumptions behind calculating emissions from water and waste. The current methods used in the greenhouse gas inventory may not sufficiently account for the innovative work already being done at the LOTT Treatment facility and Roosevelt Regional Landfill. These calculations should be updated to ensure they reflect our local conditions.

Addressing emissions from wastewater may be limited by the technology available.

While this plan outlines some initial approaches to reducing waste emissions, different priorities may emerge if we develop a process for measuring consumption-based emissions.
5.5 Agriculture, Forests, and Prairies Sector

Strategy A2. Support agricultural practices that sequester carbon.

Agriculture in Thurston County is remarkably diverse—it includes everything from large commercial dairy and egg operations to orchards to specialty vegetables grown on small urban lots. Our average farm size is small at 14 acres. Around 500 farms have livestock—mostly cattle and chickens—and a large portion of agricultural land is managed minimally for grazing and growing hay. While farms can reduce their impact with better management of animal waste and fertilizer, they can also play a role in offsetting the community’s emissions as a whole. Land management practices like cover cropping, no-till and minimum tillage conservation practices, crop rotations, soil amendments, and changes in grazing management have been shown to increase the rate of carbon stored in plants and soil. In 2020, the Washington State Legislature established the Sustainable Farms and Fields grant program, which will aid farmers and ranchers in adopting practices that increase carbon storage.

</tr>
</tbody>
</table>

Potential Impact: 🌿 Greenhouse Gas Reduction Potential 🌿 Ecosystem Health 🌿 Social Equity 🌿 Economic Benefit 🌿 Adaptation Value 🌿 Other Regional Goal 🌿 Youth Priority
Strategy A5/A6. Preserve trees and manage forests to sequester carbon.

Trees have been called the lungs of our planet, and they also can be very effective at removing carbon from the air and storing it in the soil. Historically, tall stands of Douglas fir, cedar and other tree species covered far more of Western Washington than they do today. Conserving our remaining tree canopy and restoring areas that have been cleared can help to offset emissions from other activities, while providing a host of benefits for our local environment from storing and cleaning water to providing habitat for many sensitive species.

<td></td>
<td></td>
</tr>
<tr>
<td>A6.9 tree canopy preservation. Develop a tree canopy ordinance that establishes a baseline for current urban canopy and sets goals for future canopy to increase cities’ resilience. Combine direct cooling value (urban heat island mitigation) with carbon sequestration value when evaluating urban tree management.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

What We Heard...

“The number one priority needs to be preservation of wooded areas that contain our trees for carbon reduction.”

Response to community questionnaire
Agriculture and Forest Sector: TARGETS AND INDICATORS

TARGETS
Baseline Year: 2015

- Reduce acres of fertilized land by 20 percent by 2030 and 50 percent by 2050.
- Manage 6,600 acres of agricultural land to store carbon through regenerative agriculture practices by 2030.
- Protect or replant the equivalent of 37,000 acres of forest by 2030.

KEY PERFORMANCE INDICATORS

- Acres of fertilized farmland
- Tons of sequestered carbon

SUPPLEMENTAL PERFORMANCE INDICATORS

- Percent tree canopy cover
- Acres of land using regenerative agriculture practices
- Acres of trees planted or protected
Agriculture and Forest Sector: CONSIDERATIONS FOR IMPLEMENTATION

Carbon sequestration was not included in the original suite of strategies proposed for climate mitigation but was added in response to community members who link the benefits of connecting land conversation and land management practices with climate mitigation goals. The wedge analysis shows carbon sequestration as a sizeable slice of our overall pathway to meet the 2050 emissions target. An important next step is to further analyze what actions will be required on the ground to meet our current carbon sequestration assumptions, and whether those assumptions are feasible. This may also include considering how preservation and restoration of other ecosystems, such as prairies and marine areas, may contribute to an overall carbon sequestration target.

Some stakeholders would prefer greater investment in reducing sources of emissions, before bringing sequestration into the mix of actions. If we are more effective at reducing the sources of emissions, we may need to rely less on sequestration to achieve our targets.

Another factor that will need to be addressed in implementation is how to balance preservation of trees with other priorities, such as strategies that support increased urban density and development. We will need to better define where and at what scale sequestration can be most effective, while considering other priorities.
5.6 Cross-Cutting Sector

Strategy G1. Conduct education and outreach across climate mitigation areas.

This plan focuses on the ways local government can reduce local contributions to climate change but achieving those reductions will require action from people at all levels. Many local businesses, community partners, and residents have already expressed their desire for climate action and demonstrate their commitment to improving our community. This strategy acknowledges the need for the partner jurisdictions to understand and work out how climate policies and programs can be tailored to best meet the needs of the people they serve, how to communicate in ways that inspire the change we need to meet our goals.

Potential Impact:
- Greenhouse Gas Reduction Potential
- Ecosystem Health
- Social Equity
- Economic Benefit
- Adaptation Value
- Other Regional Goal
- Youth Priority

The actions included under this strategy will not reduce emissions directly, but they will help our community understand whether we are making progress toward achieving our goals. They also aim to fill information gaps identified over the course of this planning process and highlight ways to correct our course as we learn more.

Potential Impact:
- Greenhouse Gas Reduction Potential
- Ecosystem Health
- Social Equity
- Economic Benefit
- Adaptation Value
- Other Regional Goal
- Youth Priority

While this planning process has helped answer the question of what local governments can do to address sources of climate change, it also has shed light on the limits of local authority when it comes to triggering large-scale transitions in our energy and transportation systems. The partnership among four jurisdictions that has powered this process is one of our greatest tools. By working together to advocate for strong state and federal climate action, we can amplify our influence on policy debates to come.

6. Implementation Strategy

“[Climate change] is an issue that is happening right now. It’s not something in the future, it’s right now, and we need to fix it right now, because if we start worrying about it in 10 years, that’s when it’s too late.”

Elyanna Calle, Timberline High School student, organizer of the 2019 Olympia Climate Strike
Achieving the vision and goals laid out for this plan will require bold leadership and, just as important, a sustained commitment to realizing the change necessary. It will require the attention, buy-in, and creativity of people in many different areas of our community and economy.

The Thurston Climate Mitigation Plan sets a framework for addressing the causes of climate change through actions that will reduce local sources of greenhouse gas emissions (see Figure 9). It also lays out the steps each of the four partner jurisdictions (Thurston County and the cities of Lacey, Olympia, and Tumwater) will need to take in the near term to get on track to achieving the 2030 and 2050 emission reduction targets.

This implementation strategy draws from the list of communitywide actions described in Chapter 5—Strategies & Actions, the results of the scenario analysis described in Chapter 4—Plan Development, as well as from perspectives provided by community members throughout the planning process.

6.1 Implementation Approaches

The broad strategies identified in Chapter 5—Strategies & Actions form the basis for implementation of the plan and the realization of the plan’s vision.

The suite of actions identified through the planning process cover a wide range of solutions. By including them in this plan, the intent is not to lock local jurisdictions into specific assignments, but to outline tangible, practical next steps worthy of further attention. As the plan is carried out over the next 30 years, it is expected that actions will change (be accomplished, found not affective, or new ones added), while the strategies will remain mostly unchanged. Prior to implementation, each action will require additional work to understand their feasibility, costs, and impacts.

To start that process, staff from the four partner jurisdictions grouped actions into four general approaches: legislative agenda, regionally coordinated, individual jurisdictions, and supporting partner.

**Legislative Agenda**

Over the course of the planning effort, it became clear that one of the most powerful actions available to local governments would be to use their shared influence to advocate for changes at the state level.

A number of assessed actions require steps by the state legislature to create additional authority or make other changes to state law before action can occur at the local level. Under the legislative agenda, partner jurisdictions commit to working together to advocate for changes to state law that advance our climate mitigation priorities, such as:

- Establish additional financial incentives for property owners to invest in energy efficiency upgrades, such as authority to provide local tax credits or exemptions. Such incentives should address all types of buildings, but in particular target improvements to rental housing units. Local jurisdictions can track properties receiving such incentives, once they are authorized.
- Set requirements that ensure standard building energy efficiency information is provided to prospective tenants and consumers during real estate transactions, at times of sale, lease, or rent.
• Build on changes in the state Building and Energy code to support an even faster shift toward efficient and electric appliances in new construction, and greater efficiency in smaller commercial buildings (less than 50,000 square feet).

Regional Coordination
One of the great strengths our region brings to this challenge is our history of collaborative partnership. A number of actions identified in the plan would build on existing regional programs. Others would require new partnerships to develop a shared approach. Partner jurisdictions commit to work together in the following areas:

• Buildings and permitting
  ○ Develop standard approaches to incentivize and track green building practices across our region.
  ○ Develop standard approaches to consider climate impacts in permitting decisions.
  ○ Develop model regional standards or codes for priority climate actions, including for green public buildings, land use incentives, solar and electric vehicle-ready buildings.

• Transportation planning
  ○ Support, and in some cases expand, existing programs, including the Commute Trip Reduction Program, Thurston Here-To-There, and Safe and Active Walks to School.
○ Consider, and where appropriate, address climate mitigation goals, targets, and actions in upcoming regional projects, such as the Regional Trails Plan and Capitol Campus Telework project.

○ Prioritize funding for transportation projects that advance climate mitigation priorities, including through congestion mitigation and supporting walk/bike infrastructure.

- **Food waste.** Support and expand Thurston County’s waste less food program.

- **Carbon sequestration.** Develop a regional program to track and certify carbon sequestration, including through afforestation, prairie preservation and enhancement, and regenerative agriculture.

- **Monitoring and assessment.**
  ○ Monitor our region’s progress on climate action, by continuing to track regional greenhouse gas emissions and progress toward climate mitigation targets. Incorporate additional information.
  ○ Regularly report on performance so our strategy can adapt as our understanding evolves.

- **Ongoing climate coordination and public engagement**
  ○ Support ongoing regional coordination of climate action, through the continuation of the current Steering Committee or other governance body.
  ○ Keep the community informed about climate mitigation activities and provide additional opportunities for public involvement in climate mitigation actions.
  ○ Seek and support funding for climate mitigation priorities.

**Individual Jurisdictions**

Many of the actions identified in the plan can be taken on by individual jurisdictions. Partner jurisdictions commit to addressing the following areas through their various departments and work programs:

- **Municipal Operations.**
  ○ Look for ways to reduce emissions from government operations, including by increasing energy efficiency of lighting and water systems, installing solar or other renewables on public buildings, and transitioning to electric fleets. Consider and prioritize climate impacts in capital improvement decisions.
  ○ Increase use of remote meetings, teleworking, and flexible work schedules to minimize emissions from employee travel.

- **Code and Regulatory Changes.** Review and update zoning and development codes and other regulatory programs to address priority climate actions, including solar-ready development, dense neighborhoods, electric vehicle infrastructure, and tree canopy preservation.

- **Staff development.** Dedicate resources to develop staff expertise to provide technical assistance to support climate mitigation actions like green building permitting.
Supporting Partner

Some actions identified in the plan would be best led by a different entity in the community, rather than a local government. Partner jurisdictions commit to support climate mitigation actions led by other organizations.

- Intercity Transit
- Thurston Conservation District
- LOTT Clean Water Alliance
- Thurston Economic Development Council
- Puget Sound Energy

In addition, some actions assessed in the plan may be best achieved through public-private partnerships or other types of sponsorship or collaboration.

Additional details on the communitywide implementation strategy, including leads, partners, timeframe and potential funding sources, is available in Appendix 10.6.

What We Heard...

“Give very thoughtful consideration of impacts to rural areas. We have low income people, higher vulnerability people with limited access and resources. People here have to drive long distances. The bus doesn’t get you where you need to go.”

Interview with Amy Loudermilk, Confederated Tribes of the Chehalis Reservation

“If you’re going to recommend actions, there need to be financial resources to help implement actions to keep housing affordable for low-income people, especially.”

Interview with Trudy Soucoup, Homes First

Intercity Transit is a key partner for reducing emissions from transportation. In addition to its fixed bus routes, Intercity Transit operates a vanpool program and provides outreach programs to reduce car trips by commuters and students. Source: Intercity Transit
What Can YOU DO to Take Climate Action?

Dramatic and lasting change comes from countless small shifts throughout society. Governments, business, families, and individuals all have a role to play. While this plan focuses on actions Thurston County, and the cities of Lacey, Olympia, and Tumwater can take to reduce local contributions to climate change, there are many things you can do to support that goal. Here are some ways to get started:

**Start a conversation.** National surveys have shown that while most Americans believe global warming is happening and are worried about its impacts, the majority say they rarely or never hear it discussed among their friends and family. Researchers call this the “climate change spiral of silence” —people concerned about climate change avoid talking about their concerns because they don’t hear other people talking about it. That silence can leave us feeling isolated and overwhelmed. You don’t need to be an expert on the science to let others know your hopes, fears, experiences, and actions when it comes to climate change—you might find out you share more common ground than you thought.

**Rethink your ride.** Try increasing the number of trips you make by transit, carpooling, walking, or biking. Check out your options on Thurston Here to There. Support your city in development that creates high density and mixed-use areas to reduce the need for driving. Buying a new car? Test drive an electric vehicle to see if it makes sense for you.

**Reduce energy use.** Request a free home energy assessment from Puget Sound Energy, and consider upgrading to higher efficiency appliances and fixtures. If you rely on natural gas for heat, consider switching to a ductless heat pump or other electric heat source. Investigate options for using more renewable energy at your home, place of worship, or business.

**Buy smart, buy local.** Buying smart and buying less can lower your greenhouse gas footprint. Measure the food that you throw away and take the Waste Less Food Challenge. Try a meat-free meal once a week. Choose items with less packaging and buy local to reduce emissions from shipping and packaging.

**Advocate for change.** Tell your elected officials that addressing climate change is important to you, so they know to prioritize it when making work plans and budget decisions. If you have found it difficult to take a climate action, let them know what would make it easier or less expensive. Get together with your friends, neighbors, co-workers, or a local community organization to talk about what to do next.

7. Next Steps

“The urgency to reduce emissions and prepare for global warming’s inevitable impacts has never been greater. The window of time for limiting warming to 1.5°C and 2°C continues to narrow. At the same time, additional emissions commit us to increasingly severe global and local impacts.”

- Climate Impacts Group
Plans are only as good the work they spark—the Thurston Climate Mitigation Plan is no exception. With the close of this planning process, focus can shift to carrying out the actions identified in the plan. Knowing the threat climate change poses to current and future generations of Thurston County’s residents, there is no time to lose. While the breadth of work and extent of change needed can feel daunting, this challenge presents many opportunities to build a future for our community that is innovative, resilient, and more equitable. The good news is that our region has incredible resources and spirit to make that change happen.

Following a public review period, this plan will be finalized and put forward for acceptance by the four partner jurisdictions. Supporting pieces of this plan will include:

- A monitoring framework to gauge accountability and track progress toward achieving the regional greenhouse gas emission targets. A description of the monitoring framework is included in Appendix 10.7.

- A resolution for accepting of the Thurston Climate Mitigation Plan to be considered by the four partner jurisdictions of Thurston County and the cities of Lacey, Olympia, and Tumwater.

**NOTE:** Additional information will be added to this section based on feedback gathered during the public review period and discussions by the Steering Committee.
• An interlocal agreement that outlines commitments among the four partner jurisdictions for implementation of the Thurston Climate Mitigation Plan and continued collaboration on regional climate action.

• A supplementary assessment of the costs and benefits of priority actions, and ways to address social equity in implementation of the Thurston Climate Mitigation Plan. This assessment has been awarded funding through a grant from the Washington State Department of Commerce and is scheduled to be completed by mid-2021.

While the focus of this planning process has been on what Thurston County, and the cities of Lacey, Olympia, and Tumwater can do to reduce greenhouse gas emissions and mitigate impacts from climate change, the project partners encourage all community members—individuals, neighborhoods, businesses, service organizations, and agencies—to use the information gathered here to inform your own plans and commitments to address climate change. Many adaptation and mitigation actions—large and small—are needed to help our region and planet remain resilient in the face of climate change. To succeed, each of us will need to do our part, so let’s get to work.

What We Heard...

“While local governments are the primary implementor, secondary ones will be builders, and you’ll need them to translate those actions on the ground. Make sure to liaise with the building community to understand best practices, so when it comes time to put ideas into code, things will go smoothly.”

Interview with Erin Hall, Olympia Master Builders

“Identify credible performance measures that are meaningful to the public and policy makers that can show if we are making progress.”

Response to community questionnaire

8. Glossary and Acronyms

8.1 Glossary

Action—a specific service, program, incentive, regulation or other mechanism that local governments or other partners uses to implement a strategy.

Equity—a measure of how costs and benefits of action will be distributed fairly across communities or whether actions will avoid disproportionately affecting the most vulnerable in our communities. A 2014 report by the Urban Sustainability Directors Network defined equity in the following way: “Equity in sustainability incorporates procedures, the distribution of benefits and burdens, structural accountability, and generational impact. This includes:

• **Procedural Equity**—inclusive, accessible, authentic engagement and representation in processes to develop or implement sustainability programs and policies.

• **Distributional Equity**—sustainability programs and policies result in fair distributions of benefits and burdens across all segments of a community, prioritizing those with highest need.

• **Structural Equity**—sustainability decision-makers institutionalize accountability; decisions are made with a recognition of the historical, cultural, and institutional dynamics and structures that have routinely advantaged privileged groups in society and resulted in chronic, cumulative disadvantage for subordinated groups.

• **Transgenerational Equity**—sustainability decisions consider generational impacts and don’t result in unfair burdens on future generations.”

Sector—a grouping of sources of greenhouse gas emissions (such as, Buildings and energy), and related strategies and actions that address those sources.

Strategy—a method or general approach to achieve a desired goal; in this case, a reduction in greenhouse gas emissions from a particular sector.

8.2 Acronyms

**GHG**—Greenhouse Gas

**MTCO2e**—metric tons of carbon dioxide equivalent

**TCAT**—Thurston Climate Action Team

**TRPC**—Thurston Regional Planning Council
